SCH. 40

SDR21

IRRIGATION LINES EXPLAINED

Hypothetically, both pipes are equally valid options when designing your irrigation system. However, we only use schedule 40 pipe because of its increased durability. Meaning, if someone is digging in your garden bed, or drives on your lawn, you won't have to worry about an expensive water leak

- Sch. 40 often has 150% thicker outer-wall than SDR 21
- Sch. 40 can withstand 480psi at 3/4 inch, while SDR 21 can only withstand 200psi
- Sch. 40 pipe, on average, raises your project cost by \$0.012 per foot
